IN THE CLAIMS

1. (currently amended) A network system which controls communication between a user terminal and a peer terminal thereof over a network including a mobile domain, comprising:

(a) a home agent, coupled to the peer terminal, which maintains the location of the user terminal and tunnels packets for delivery to the user terminal;

(b) a foreign agent which detunnels and delivers the packets to the user terminal that is visiting a foreign network;

(c) a service control database which maintains a customizable service profile defining what class of service to provide to the user terminal;

(d) a home server located in a first administrative domain to which the user terminal belongs, comprising:

service profile setting means for retrieving the service profile from said service control database when the user terminal initiates a communication session, and distributing and setting the retrieved service profile to said home agent and foreign agent as an initial service profile, the service profile variably specifying services that the user terminal requires depending on control conditions, and

service profile updating means for generating an event signal when one of the control conditions described in the retrieved service profile is met, obtaining a new service profile from said service control database in response to the event signal, and distributing the new service profile so as to replace the initial service profile being set in said home agent and foreign agent; and

(e) a foreign server located in a second administrative domain, which forwards the initial service profile and new service profile from said home server to said foreign agent, wherein said

home agent performs route optimization when a packet from the peer terminal is intercepted and tunneled to the user terminal, keeps a record about the peer terminal that has been subjected to the route optimization, and refers to the record to identify the peer terminal when a service profile change request is received from said home server; and

(f) conflict avoiding means for avoiding a conflict between said service profile updating means activated by the event signal detected in said home server and a person who is attempting to modify the service profile stored in said service control database, wherein said conflict avoiding means deactivates the event signal in case of conflict, and after the modification of the service profile is finished, redistributes the service profile and reactivates the event signal.

2. (original) The network system according to claim 1, wherein said home server generates the event signal for the update of the service profile by detecting at least one of:

- an event related to user authentication,
- an event related to authorized use of network resources, and
- an event related to accounting functions.

3. (original) The network system according to claim 1, further comprising a network control mechanism which informs said home server of an event that is detected therein, while supervising and managing the network.

4. (original) The network system according to claim 3, wherein said service profile updating means in said home server obtains and distributes the new service profile in response to the event informed by said network control mechanism.

6. (original) The network system according to claim 1, wherein said home server allocates said home agent when the user terminal initiates the communication session.

7. (original) The network system according to claim 6, further comprising another foreign agent located within the second administrative domain, and which sends a service profile change request message to the user terminal's previous foreign agent when the user terminal has moved and registered with said another foreign agent.

8. (original) The network system according to claim 6, further comprising:  
another foreign server which covers a third administrative domain, and  
another foreign agent which is located within the third administrative domain,  
wherein said home server sends a service profile change request message to both the user terminal's previous foreign server and said another foreign server when the user terminal has moved and registered with said another foreign agent.

9. (original) The network system according to claim 1, wherein said foreign server allocates said home agent when the user terminal initiates the communication session.

10. (original) The network system according to claim 9, further comprising another foreign agent which is located within the second administrative domain, and which sends a

service profile change request message to the user terminal's previous foreign agent when the user terminal has moved and registered with said another foreign agent.

11. (original) The network system according to claim 9, further comprising:  
another foreign server which is located in a third administrative domain, and  
another foreign agent which covers another foreign network within the third administrative domain,

wherein said home server sends a service profile change request message to both the user terminal's previous foreign server and said another foreign server when the user terminal has moved and registered with said another foreign agent.

12. (original) The network system according to claim 1, further comprising an address translation server which provides a service using predetermined address translation rules, wherein said service profile updating means in said home server produces and distributes the new service profile when an event related to the address translation rules occurs during the service.
